

## Submersible Pump Sizing & Selection

Presented by National Exploration, Wells & Pumps

## Office Locations

## Outline

- 1. Why pump size matters
- 2. How submersible pumps work
- 3. Pump parameters
- 4. Pump selection
- 5. Maintenance & Repair

## Size Matters!

## Pump size determines well diameter. NOT THE OTHER WAY AROUND!!!

## **Key Parts**

- 1. Discharge -
- 2. Check Valve
- 3. Impeller\_\_\_\_\_

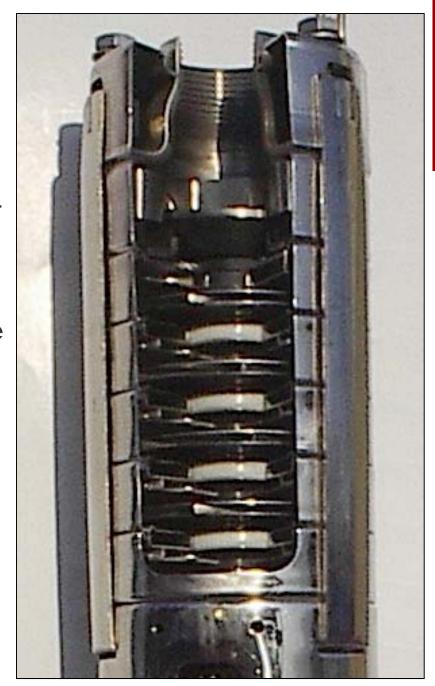

4. Intake-

5. Motor -

## How it works

- Each combination of a chamber with an impeller is referred to as a "stage" or "bowl"
- Each stage adds lift to the pump
- 3. The impellers are directly connected to the motor which creates flow.
- 4. As with all variable displacement pumps: flow rate is inversely related to the head pressure.

## Pump Parameters

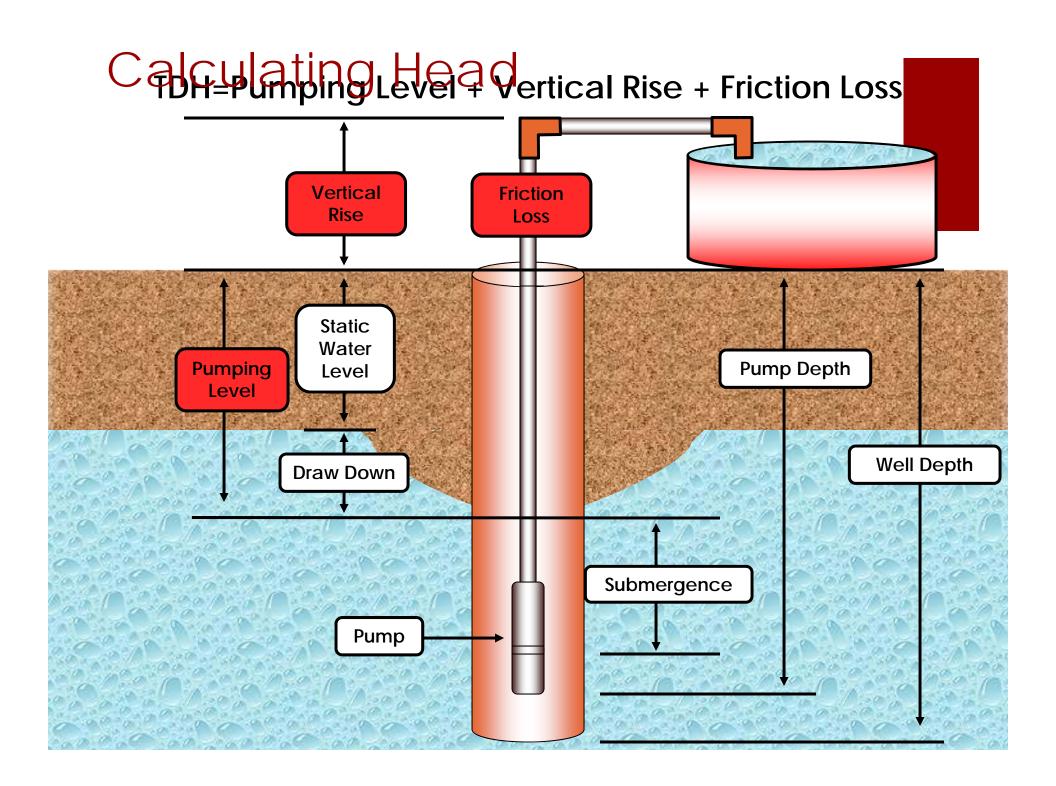

Q: So what determines the necessary size of the pump?

A: Flow rate & the amount of lift required.

- 1. Flow Rate: Make sure the aquifer is capable of supporting your desired flow rate. Do you have any pump test data? Why not?
- Lift: Submersible pumps do not build pressure. They
  provide lift which overcomes head pressure, which is
  measured in feet.

The head pressure against which a submersible pump operates is referred to as...

TOTAL DYNAMIC HEAD (TDH)

## Friction Loss Table – VALVES and FITTINGS

(Friction Loss in Equivalent Number of Feet of Straight Pipe)

		NOMINAL SIZE OF FITTING AND PIPE

## Pump Selection

Q: So I know my flow rate and system TDH. Now what?

A: Start shopping!

1. Pump suppliers publish pump curves for all the various models. Select your flow range...

## Pump Selection

Q: So I know my flow rate and system TDH. Now what?

A: Start shopping!

- Pump suppliers publish pump curves for all the various models. Select your flow range...
- 2. They also provide "easy selection charts" which are just pump curves for several models of pumps in a table format.

# Worksheet: Peter Piper picked a peck of pickled pumps!

### How to size a pump:

- 1. What is required/desired flow (GPM)
- 2. Determine TDH
- 3. Consult Pump Curve(s)
- 4. Select wire size

### How to size a pump:

What is required/desired flow? 5 GPM

**Determine TDH** 

First, let's calculate friction loss!

Friction loss = total length X friction loss (straight pipe) factor + friction loss (fittings)

Friction loss = (\_\_\_\_' X \_\_\_\_') + (\_\_' X \_\_)

Friction loss = \_\_\_\_' + \_\_\_\_'

Friction loss = \_\_\_\_\_' Head Pressure

Now we can calculate TDH!

TDH = pumping level + vertical rise + friction loss

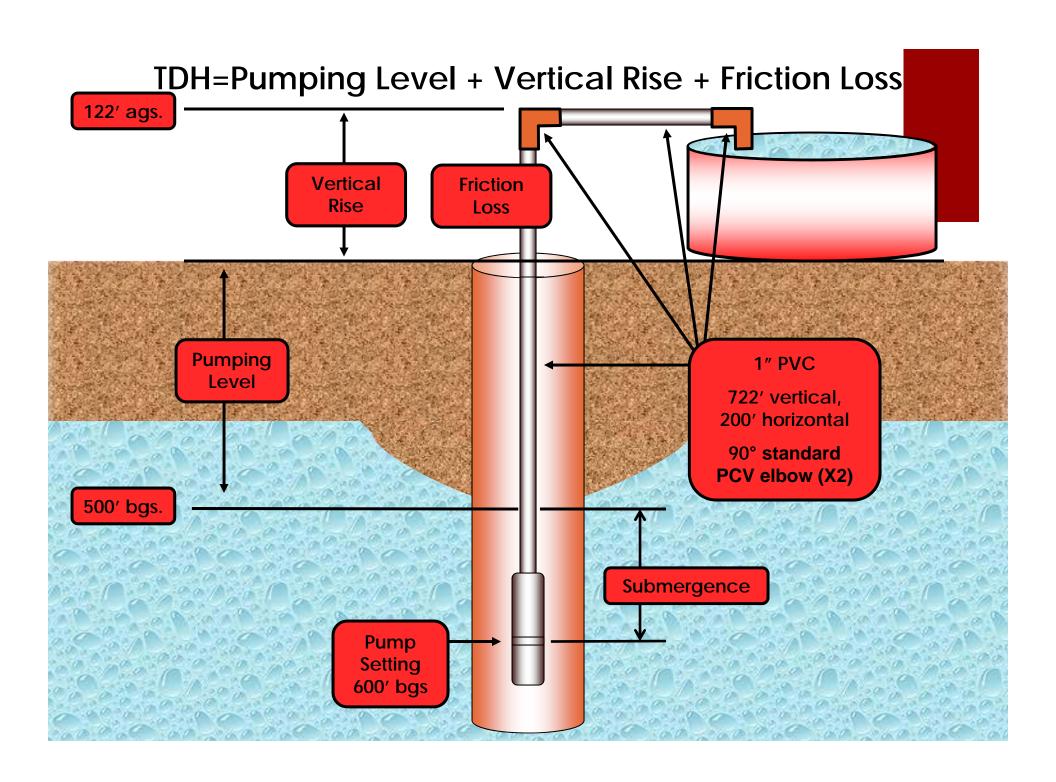

TDH = \_\_\_\_' + \_\_\_\_' + \_\_\_\_'

TDH = \_\_\_\_\_′

Now that we know the TDH and required/desired flow, we can select a pump from a performance curve.

Which 4" pump/motor combination will deliver 5 GPM at the calculated TDH?

\_\_\_\_\_

### How to size a pump:

What is required/desired flow? 5 GPM

**Determine TDH** 

First, let's calculate friction loss!

Friction loss = total length X friction loss (straight pipe) factor + friction loss (fittings)

Friction loss = 
$$(922 \cdot \chi - 1.8) / (100 \cdot ) + (3) (1.8) / (100)$$

Friction loss =  $16.60_{+} + 100_{-}$ 

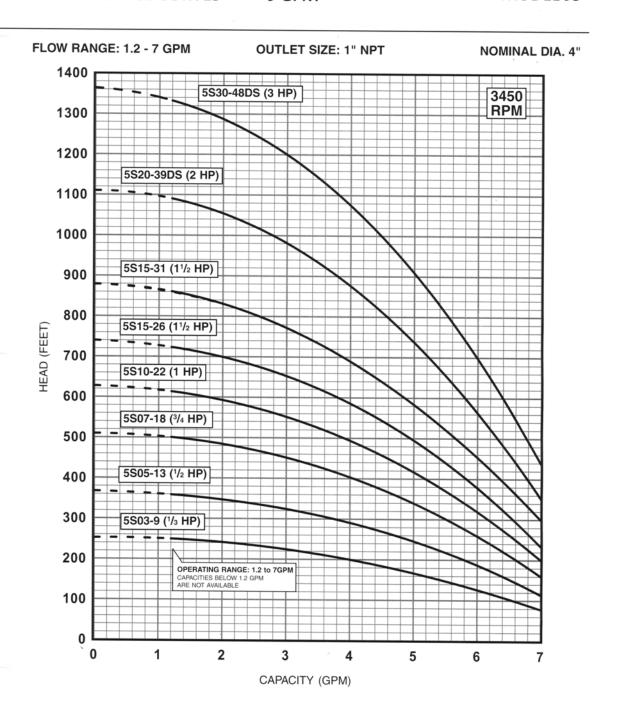

Friction loss = 17 'Head Pressure

Now we can calculate TDH!

TDH = pumping level + vertical rise + friction loss

$$TDH = 739$$

Now that we know the TDH and required/desired flow, we can select a pump from a performance curve.

### How to size a pump:

What is required/desired flow? 5 GPM

**Determine TDH** 

First, let's calculate friction loss!

Friction loss = total length X friction loss (straight pipe) factor + friction loss (fittings)

Friction loss = 
$$(922 \cdot \chi - 1.8) / (100 \cdot ) + (3) (1.8) / (100)$$

Friction loss =  $16.60_{+} + 108_{-}$ 

Friction loss = 17 'Head Pressure

Now we can calculate TDH!

TDH = pumping level + vertical rise + friction loss

$$TDH = 739$$

Now that we know the TDH and required/desired flow, we can select a pump from a performance curve.

Which 4" pump/motor combination will deliver 5 GPM at the calculated TDH?

5S20-39DS (2 HP).

### MAXIMUM MOTOR CABLE LENGTH

 The gauge of the wire is a function of your operating voltage and length.

## Maintenance & Repair

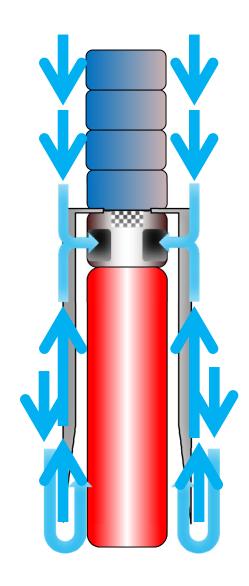

- Q: It's been two years and the bowls are worn out on my submersible pump. What do I do?
- A: Go back in time and design a better well screen and filter pack.
- A: Okay, you'll have to pull the pump. Go ahead and hire someone with a well service rig. DON'T TRY IT YOURSELF!
- Well professionals have the right kind of equipment to pull a submersible pump without damaging the drop pipe, power cable and pump itself.
- You don't.

## Maintenance & Repair

Q: My pump just stopped working. What happened?

A: A lot of things could be the problem, but a common issue is motor burn-out.

- If water doesn't flow around the motor housing on its way to the intake, the motor isn't being cooled properly. This can lead to overheating.
- Set your pump above your screen interval but below your dynamic pumping level so water comes from below.
- If conditions preclude this design, consider a shroud.

## Thank You

I should have hired National!
